

TryNex Lifestyle Production Audit — Final Status

Prepared by: Manus AI

Audit window: 15–16 August 2026 UTC

Repository: georgelsmith333-hub/trynex-lifestyle

Live host: trynex-lifestyle-shop.pages.dev

Executive assessment

The TryNex storefront is deployable and materially more stable than the prior baseline. The Google OAuth origin mismatch was corrected at the configuration level, the v2 source-tracked mockup resolver and silhouette clipping are deployed, the homepage and Long Sleeve merchandising routes were corrected, the global header offset and draft-reminder obstruction were improved, and the production CI build and security gates are green for the final rollback commit `cc31a46`. The live catalog now exposes 70 products, reaches a second page containing the remaining 20 products, and correctly isolates 10 Long Sleeve products with canonical image paths. The checkout implementation now has the requested wallet-only customer path: 25% advance, configured bKash/Nagad/uPay number, required sender-number last four digits, optional screenshot proof, one payment-submission action, and backend `paymentStatus: submitted` persistence.

The platform should **not yet be marked fully finished** against the user's "perfect smart mockup" acceptance bar. The live black hoodie still shows a small pale side-edge/underarm artifact and the complete six-product, all-color, all-face matrix has not been fully captured. A dark-pixel alpha filter experiment was explicitly rejected after live verification because it produced an undesirable gray-body/black-wing appearance; it was reverted in `cc31a46`. A real order, payment proof upload, admin payment confirmation, and final Google account-selection credential exchange were not executed because they are state-changing or require an authenticated account and explicit confirmation.

Status matrix

Area	Current status	Evidence	Remaining work
Google OAuth origin	Configuration fixed; account-selection exchange not finally verified	Replacement Google Web client and live origin were configured in the prior wave	Perform one authenticated sign-in and confirm <code>/api/auth/google</code> session establishment
Smart mockup architecture	Implemented and deployed	v2 manifest/resolver, transparent source-kit paths, SVG silhouette clipping, protected garment detail masks	Replace or normalize source pixels causing the remaining dark apparel edge artifact; complete six-product matrix
Black hoodie	Improved but not production-perfect	Live cache-busted rollback screenshot shows one hoodie layer, hood, cords, pocket, sleeves, and hem	Fix source-level pale edge/underarm pixels without changing the actual product shape
Homepage merchandising	Implemented in prior wave	Six-family hero and corrected mug/customization copy were part of the deployed wave	Recheck every CTA at mobile width in a dedicated browser session
Long Sleeve catalog filter	Pass	Live filter returns 10 product cards with <code>/assets/products/longsleeve_*.png</code> images	None for the slug defect; continue broader category QA
Catalog pagination	Pass	Live page 1 reports 50 products; page 2 renders 20 products	Consider API-level page metadata alignment and self-host legacy external images
Product image delivery	Mixed	Canonical assets render; several page-2 legacy products use Unsplash/Imgur URLs	Migrate external assets into controlled storage and add lazy loading/preload strategy
Checkout page routing	Safe empty-cart behavior	<code>/checkout</code> with no cart state redirects to <code>/cart</code> and shows an empty-bag page	Perform a confirmed test order with a disposable/dummy cart item

Area	Current status	Evidence	Remaining work
Payment gateway UX	Source contract passes read-only audit	Wallet-only selector; 25% advance; last four required; proof optional; one submission button	Execute one confirmed test order and verify Admin Panel evidence display
Order submission	Not live-transaction verified	Backend and frontend paths are present and type/build checked	User confirmation required before creating a real or dummy order
Admin panel	Not fully live-verified in this audit	Source and previous context indicate payment/order controls exist	Authenticated read-only dashboard check, then payment-status evidence check after a test order
Tracking	Route loads	<code>/track</code> showed heading, fields, Track Order control, and trust cards	Verify with an actual order reference after a confirmed test order
CI/build/security	Pass	<code>cc31a46 : build-and-check=success , security-scan=success ; local npm build succeeded</code>	Keep future changes focused and re-run both gates
SEO/blog discoverability	Not fully verified	Route inventory and SEO components exist from prior audit context	Use Search Console/site-query evidence and crawl/index checks before making indexing claims

Verified live findings

Catalog and API

The live products page exposes 70 total products and a visible page-1/page-2/Next control. Page 1 reports 50 products. Page 2 renders 20 additional cards with names, prices, product links, and image URLs. Selecting Long Sleeves loads 10 results, including `Cozy Waffle Knit Long Sleeve`, `Retro 80s Grid Long Sleeve`, and eight additional products. The direct Pages proxy API returned `total: 70`; the `category=long-sleeves` request returned `total: 10`, `categoryName: Long Sleeves`, canonical image paths, sizes, colors, stock, variants, ratings, and customization flags [1](#).

The remaining catalog risk is asset ownership and performance: several legacy page-2 cards reference `images.unsplash.com` or `i.imgur.com`. These URLs are not controlled by TryNex and may produce slower

or less reliable first loads than locally hosted assets. They should be migrated into the project’s existing asset/storage convention rather than replaced with more placeholder images.

Checkout and payment contract

With an empty persistent cart, the live `/checkout` route safely resolves to `/cart` ; no order or payment data was changed. The source contract shows that customer-facing payment choices are built from configured bKash, Nagad, and uPay wallet methods only. Unsupported bank/card/COD branches remain as defensive or legacy code paths but are not included in the visible method selector. The checkout defaults to 25% advance and records the remaining balance as cash on delivery 3.

The gateway has one merchant-number copy control, one required last-four field, an optional screenshot upload, and one `I've Sent the Payment` action. The backend validates exactly four wallet digits, appends payment method/last-four/proof evidence to order notes, sets `paymentStatus` to `submitted` , and creates a customer notification when a customer account is attached 4. This is a strong contract-level result, but it is not equivalent to a completed live order test.

Smart mockup renderer

The current renderer follows the project’s required one-canonical-source model: customer artwork is separate from product source imagery; garment categories use normalized source-kit paths; apparel artwork is clipped with category-specific SVG silhouette paths; and hoodie detail strips remain above artwork to protect cords and product details 5. The live black hoodie screenshot confirms the visible product is a single source layer with the expected hood, drawstrings, kangaroo pocket, sleeves, and hem.

The rejected experiment is important evidence rather than a failure to disclose. The dark-garment alpha matrix filter was pushed as `c057332` , passed CI, and was visually rejected on the live site because it produced a gray central garment with black wing-like edge artifacts. It was removed and the stable renderer restored in `cc31a46` , which passed both CI jobs. This means the remaining defect belongs to source normalization or a precise silhouette/mask contract, not to an unverified “magic” color filter.

Deployment and engineering gates

Gate	Result
Storefront typecheck after final rollback	Passed
Storefront production build	Passed locally; Vite emitted only the existing large-chunk warning
Git diff hygiene	Passed for the focused renderer changes
GitHub <code>build-and-check</code> for <code>cc31a46</code>	Passed
GitHub <code>security-scan</code> for <code>cc31a46</code>	Passed
Final repository state	<code>cc31a46</code> on <code>main</code> and pushed to origin

The build still reports large JavaScript chunks, including the 3D and editor bundles. This is a performance warning, not a build failure. The next performance wave should lazy-load the editor/3D routes and migrate external catalog images, while preserving the current stable behavior.

Priority implementation plan

1. **Source-level mockup correction.** Inspect the active black/colored apparel cutouts and alpha bounds, remove only the pale edge pixels from the source or introduce a bounded silhouette alpha mask, then repeat live checks for white, black, navy, grey, maroon, olive, red, sky blue, forest, and burgundy across T-shirt, Long Sleeve, and Hoodie.
2. **Six-product matrix.** Capture and record front/back/side behavior for apparel, mug left/right, cap crown, and ring-cap bottle body. Confirm artwork never crosses the handle, rim, cap, carabiner, shoulder, pocket, cords, cuffs, or hem.
3. **Confirmed order test.** With explicit confirmation, add a disposable test cart item, submit a 25% bKash/Nagad/uPay order using test sender suffix `1111`, optionally attach a non-sensitive screenshot, confirm the success/tracking route, and then inspect Admin Panel payment evidence. Do not use a real customer's payment details.
4. **OAuth account test.** Complete one authenticated Google account-selection test and record whether `/api/auth/google` returns a valid session. Do not store or expose credentials.
5. **Asset/performance wave.** Self-host the remaining Unsplash/Imgur catalog images, add width/height metadata and lazy-loading policy, and route editor/3D bundles through dynamic imports.
6. **SEO verification.** Validate canonical URLs, robots/sitemap, blog route status, and Search Console indexing using actual crawl/index evidence rather than assuming route presence equals discoverability.
