

TryNex Lifestyle Production Audit — v3 Rebuild Status

Prepared by: Manus AI

Audit window: 15–16 August 2026 UTC

Repository: georgelsmith333-hub/trynex-lifestyle

Live host: trynex-lifestyle-shop.pages.dev

Latest evidence commit: e85328b

Latest deployed application commit: d42b27a

Executive assessment

The TryNex platform has now received a source-level smart-mockup rebuild rather than another renderer-only patch. A canonical **source-kit-v3** was generated for the six product families with front/back coverage, transparent alpha validation, checksums, and auditable manifest metadata. The active production Design Studio route was traced to `src/pages/studio/DesignStudioV2.tsx` ; previous fixes had been applied to a legacy V1 file and therefore did not affect `/design-studio` . The active V2 route is now corrected to recognize Long Sleeve and Water Bottle aliases, preserve explicit product deep links over cloud/local draft restoration, and delay URL synchronization until initial query parsing has completed.

The rebuilt production branch is deployable: storefront typecheck passed, the remote build-and-check gate passed, the remote security scan passed, and Cloudflare Pages deployed the active V2 correction as production deployment `94d26b2d` . Live checks confirm Long Sleeve, Mug, Water Bottle, and Cap resolve to their correct templates. The Water Bottle homepage and hero links now target the verified `water-bottles` API category, which returns 10 real products. The system should still **not** be described as fully perfect across every color, face, uploaded-design scenario, admin action, OAuth account exchange, or real order transaction until those stateful checks are executed and recorded.

Current status matrix

Area	Status	Evidence	Remaining risk
Source-kit-v3	Implemented and internally validated	108 transparent front/back PNG assets, manifest/checksum validation, six-family contact sheets	Generated source quality still needs complete live all-color/all-face acceptance
Active Design Studio route	Fixed and deployed	/design-studio uses DesignStudioV2 ; explicit Long Sleeve query now resolves correctly	Complete T-shirt/Cap fresh-session visual matrix is still incomplete in the browser harness
Long Sleeve	Live pass	product=long-sleeves normalizes to product=longsleeve ; complete black Long Sleeve rendered	Validate all colors and back/side faces with uploaded artwork
Hoodie	Improved; source-level artifact remains under observation	v3 contact sheets and prior live checks show complete product silhouette	Pale edge/underarm pixels must be rejected or corrected if reproduced in a fresh live matrix
T-Shirt	Pending isolated live acceptance	v3 source and resolver coverage exist	Browser session repeatedly retained another product during attempted route navigation
Mug	Live pass for route and controls	Correct Coffee Mug template; Left Side, Right Side, and Wrap controls visible	Confirm curved artwork placement and handle exclusion with a real uploaded design
Cap	Live pass for route and	Correct Structured Cap template and black cap	Confirm color matrix and any supported

Area	Status	Evidence	Remaining risk
	silhouette	front rendered	crown print-zone behavior
Water Bottle	Live pass for route and silhouette	Correct 600ml Aluminium template with ring-cap/carabiner silhouette	Confirm curved artwork mapping, back behavior, and exclusion zone with uploaded content
Homepage merchandising	Corrected and pushed	Six-family cards use v3 assets; Water Bottle links use <code>water-bottles</code>	Final mobile CTA check remains useful
Catalog API	Pass	70 total products; 10 Long Sleeves; 10 Water Bottles; page 2 renders 20 products	Legacy external image URLs remain a performance/ownership risk
Print-zone default	Corrected	Shared Design Store defaults <code>showPrintZone: false</code>	Confirm on all responsive breakpoints after a fresh browser load
Editor auto-scroll	Corrected in prior wave	Forced desktop auto-scroll removed	Test every tool panel with mouse and keyboard interaction
Checkout contract	Read-only contract pass	Wallet-only visible path, 25% advance, required last four digits, optional proof, single submit action	No confirmed dummy or real order was submitted in this audit
Admin payment/order flow	Not statefully verified	Source contract and previous audit evidence exist	Requires authenticated dashboard and a test order/payment record
Google OAuth	Origin configuration fixed; exchange	Replacement Web client and live origin configured	Requires one authenticated account-selection test

Area	Status	Evidence	Remaining risk
	not finally verified		
CI/build/security	Pass	e85328b workflow build-and-check and security-scan passed; 430e35b also passed	Keep future changes focused
Cloudflare deployment	Pass	d42b27a production deployment completed; 430e35b active V2 fix deployed as 94d26b2d	Preview URLs may be Cloudflare Access-gated; canonical host is the public acceptance surface
SEO/blog	Not fully verified	Routes and SEO components exist	Search Console/crawl evidence is still required

Source-kit-v3 rebuild

The rebuild uses a deterministic source-kit builder and separate normalization/extraction tools. The runtime matrix contains six categories: T-shirt, Long Sleeve, Hoodie, Mug, Cap, and Water Bottle. Each category has explicit front/back assets, transparent corners, nonempty alpha bounds, and checksums represented in the v3 manifest. Apparel sources retain product silhouette and protected details instead of layering a second opaque garment image over customer artwork.

The generated contact-sheet review found that the new front silhouettes are substantially more complete than the previous cutouts. Long Sleeve sleeves, cuffs, hems, hoodie sleeves, hood, pocket, and cords remain present. Water Bottle assets retain the requested ring-cap/carabiner shape. Mug assets retain handle-side geometry. The acceptance record also notes that some reconstructed colored backs are visually simpler than the strongest front photography; this is not being hidden behind a claim of perfect PSD/PSB equivalence.

The current implementation is a **PSD/PSB-style runtime contract**, not a binary Photoshop file generator. Its manifest records editable-master paths, faces, zones, masks, dimensions, alpha bounds, and checksums; the browser compositor renders customer layers over transparent product surfaces. If true Photoshop Smart Object files are required for downstream Photoshop editing, that is a separate deliverable and should not be conflated with the browser renderer.

Root-cause correction for the live Long Sleeve failure

The earlier deep-link fix was applied to `src/pages/DesignStudio.tsx`, but the public `/design-studio` route is mounted by `src/pages/studio/DesignStudioV2.tsx`. Consequently, the live route continued to fall back to Hoodie even though the legacy file contained the correct alias map.

Commit `430e35b` corrected the active V2 component by adding normalized aliases for `long-sleeve`, `long-sleeves`, `longsleeves`, `water-bottle`, `water-bottles`, and `bottle`; preventing cloud/local drafts from replacing an explicit URL product; and guarding URL synchronization until startup parsing is complete. The public production test then resolved `/design-studio?product=long-sleeves` to `?product=longsleeve` and rendered **Unisex Long Sleeve 240GSM Cotton** with a complete black long-sleeve silhouette.

The same active route was checked for Mug, Water Bottle, and Cap. Mug exposed its three side modes, Water Bottle showed the ring-cap silhouette, and Cap showed the structured cap front. A T-shirt attempt in the existing browser harness repeatedly retained a previous product state; therefore T-shirt is conservatively marked pending fresh-session acceptance rather than falsely marked pass.

Homepage and catalog routing

The homepage category map and hero product grid now route Water Bottle cards to `/products?category=water-bottles`, matching the live backend. The repeatable API audit returned 70 total products, 10 Long Sleeves, and 10 Water Bottles with valid product metadata and canonical image paths. The existing catalog pagination still exposes 50 products on page 1 and 20 products on page 2.

Several older page-2 records still reference external Unsplash or Imgur URLs. This does not invalidate catalog correctness, but it creates avoidable loading, availability, privacy, and cache-control risk. Those assets should be migrated into controlled project storage with explicit dimensions and lazy-loading behavior.

Checkout, payment, and admin boundaries

The checkout source contract remains aligned with the requested customer flow: bKash, Nagad, and uPay are the visible wallet choices; the customer pays 25% in advance; the remaining balance is cash on delivery; the sender's last four digits are required; a payment screenshot is optional; and one payment-submission action persists a submitted payment status and evidence note on the order.

This audit did not create a dummy or real order, upload a payment screenshot, confirm an order in the Admin Panel, or perform a live Google account exchange. Those operations mutate

customer/order/authentication state and must be executed only with explicit confirmation and, where needed, user takeover. The implementation is therefore contract-verified, not end-to-end transaction-verified.

Engineering gates

Gate	Result
Storefront typecheck after active V2 fix	Passed
430e35b build-and-check	Passed
430e35b security scan	Passed
e85328b build-and-check	Passed
e85328b security scan	Passed
Cloudflare Pages deployment for active V2 fix	Passed; production deployment 94d26b2d
Local full Vite build	Process terminated during gzip sizing in the sandbox; remote CI completed successfully
Source-kit-v3 acceptance checker	Passed for all 108 generated assets

Prioritized next wave

1. Run an isolated six-family live visual matrix for T-shirt, Long Sleeve, Hoodie, Mug, Cap, and Water Bottle across every supported color and face. Record screenshots and reject any pale edge, halo, duplicate layer, missing sleeve, incorrect handle, or wrong bottle cap.
2. Upload one controlled non-sensitive test artwork per product family and verify auto-fit, clipping, curvature, protected details, delete controls, export, cart thumbnail, and cross-product draft behavior.
3. Perform one explicitly confirmed disposable checkout order using a non-sensitive test payload, then inspect the order, payment evidence, notification, tracking reference, and Admin Panel status controls.

4. Complete one authenticated Google Sign-In account-selection test and verify `/api/auth/google` session establishment without storing credentials.
5. Self-host legacy catalog images, add intrinsic dimensions and lazy loading, and measure editor/3D bundle loading on mobile and desktop.
6. Verify homepage, catalog, Design Studio, checkout, tracking, admin, and blog routes at mobile and desktop widths, specifically checking header offsets, floating widgets, cursor scrolling, sticky panels, and content cutoff.
7. Validate robots, sitemap, canonical URLs, structured data, and blog indexing with actual crawl/Search Console evidence.

Repository evidence

- `430e35b` — active Design Studio V2 deep-link and v3 prefetch correction.
- `d42b27a` — homepage Water Bottle merchandising-route correction.
- `e85328b` — live Water Bottle API evidence and rebuilt visual acceptance record.
- `verification/rebuild-visual-acceptance-baseline.md` — detailed source-kit, contact-sheet, live-route, and remaining-risk evidence.
- `verification/check_live_products_api.py` — repeatable catalog API audit.
- `artifacts/trynex-storefront/src/pages/studio/DesignStudioV2.tsx` — active production Design Studio route.
- `artifacts/trynex-storefront/src/pages/design-studio/mockups.tsx` — canonical v3 resolver and render contract.
- `artifacts/trynex-storefront/src/pages/design-studio/smart-mockup-manifest.ts` — v3 manifest schema.
