Wave 2 full-stack audit and Smart Object release overview

Audit date	2026-09-02
Release scope	Six product families / 188 canonical surfaces
Current release state	structurally-verified; visualApproval=False
Runtime policy	Current reviewed runtime assets remain active; generated editable masters stay quarantined
Overall conclusion	Application and dependency gates pass. Native Smart Object promotion remains fail-closed pending controlled visual/runtime acceptance.

This report records the continuation verification rather than relying on earlier audit claims. It separates structural proof from visual approval, keeps authenticated evidence honest, and preserves existing commerce, Design Studio, mobile, storage, auth, and deployment behavior.

Executive result

The full 188-surface quarantine release is structurally complete. Every generated PSD reopened successfully, contains one non-empty embedded Smart Object, and has a non-empty composite preview. The canonical matrix and checksums also pass.

Release gates

Smart Object release gate	PASS - 188/188 surfaces, checksums present, embedded payloads present, public-path separation confirmed
PSD reopen audit	PASS - 188/188; 1024 x 1024; 8-bit; one Smart Object per file; non-empty payload and composite
Canonical matrix	PASS - 188/188 expected surfaces and checksums
Visual contact sheets	Reviewed for completeness and family/color/face coverage; proof guides are intentionally visible
Visual approval flag	FALSE - no controlled browser/runtime comparison or owner sign-off was available
Promotion decision	BLOCKED by fail-closed policy; quarantine only

What is deliberately not claimed

- The new PSD masters are not claimed as active production runtime assets.
- Authenticated admin-health success is not claimed because no safe credential/session path was available.
- A fresh browser screenshot is not claimed because the artifact preview registry could not resolve this checkout and browser-use is unavailable.

Smart Object matrix evidence

The generated release covers T-shirt, hoodie, long sleeve, mug, cap, and the canonical white sublimation water bottle. Each surface carries provenance, geometry, print-zone coordinates, a checksum, and an embedded artwork object. Editable masters remain outside public/.

Surface count	188/188
Manifest status	structurally-verified
Native Smart Objects	True
Editable masters outside public	True
Visual approval	False
Runtime fallback	Preserved reviewed smart-v9/current source-matrix assets; no automatic promotion

Preserved product rules

- White bottle remains white-only with front/back canonical surfaces.
- Reviewed T-shirt, white bottle, and color-specific hoodie/long-sleeve runtime sources remain authoritative.
- Customer uploads, cart/checkout metadata, product switching/refit, curved-product behavior, settings-driven commerce, auth, storage, and deployment paths were not replaced.
- The generated source kit is quarantine evidence, not a public asset bundle.

Application and security verification

Storefront tests	PASS - 22 files / 76 tests
API tests	PASS - 6 files / 26 tests
Storefront/API typechecks	PASS
Full workspace typecheck	PASS
Storefront and API builds	PASS
Mobile Expo web export	PASS
Expo compatibility check	PASS - expo 54.0.37 and expo-constants 18.0.14
Safe image-size parser tests	PASS - buffer and path inputs, PNG/GIF/BMP/SVG/PSD coverage
pnpm audit	PASS - 0 info/low/moderate/high/critical advisories
image-size lock exposure	PASS - no upstream image-size 1.x entry; Metro resolves local bounded parser
git diff --check	PASS

The dependency remediation was validated against Metro's actual contract: its asset scanner can pass either an image buffer or a file path and recognizes PNG, JPEG, BMP, GIF, WebP, PSD, SVG, TIFF, and KTX families. The local parser enforces a 64 MiB input ceiling and fails closed on unsupported or malformed data.

Protected route and runtime checks

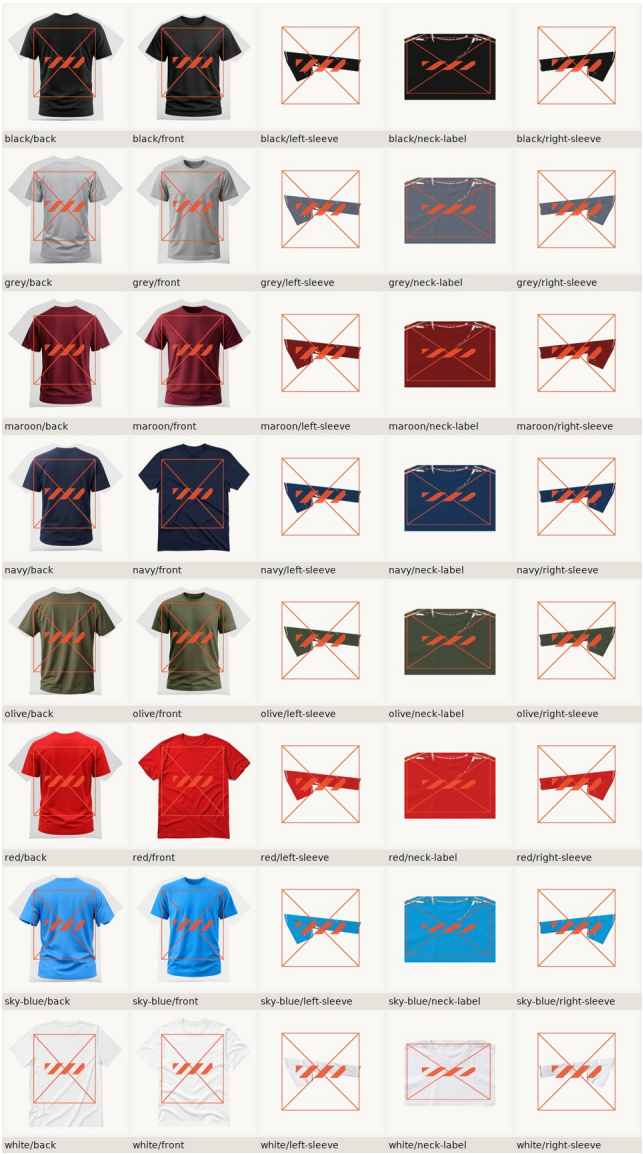

- GET /api/admin/system/health returned 401 for no auth, invalid Bearer, and invalid Basic credentials.
- GET /api/healthz, /api/health/liveness, and /api/health/readiness returned 200 after the managed workflow restart.
- Products, categories, settings, sitemap, robots, and representative mockup assets returned expected responses.
- Redis is degraded because the current environment rejects its credentials; the documented fallback remains operational.

Visual evidence: staged contact sheets

These pages embed the generated family contact sheets. They are evidence of matrix coverage and proof-preview composition, not a substitute for a controlled browser/runtime comparison.

Tshirt contact sheet

Coverage evidence. Red guides are intentional print-zone review guides.

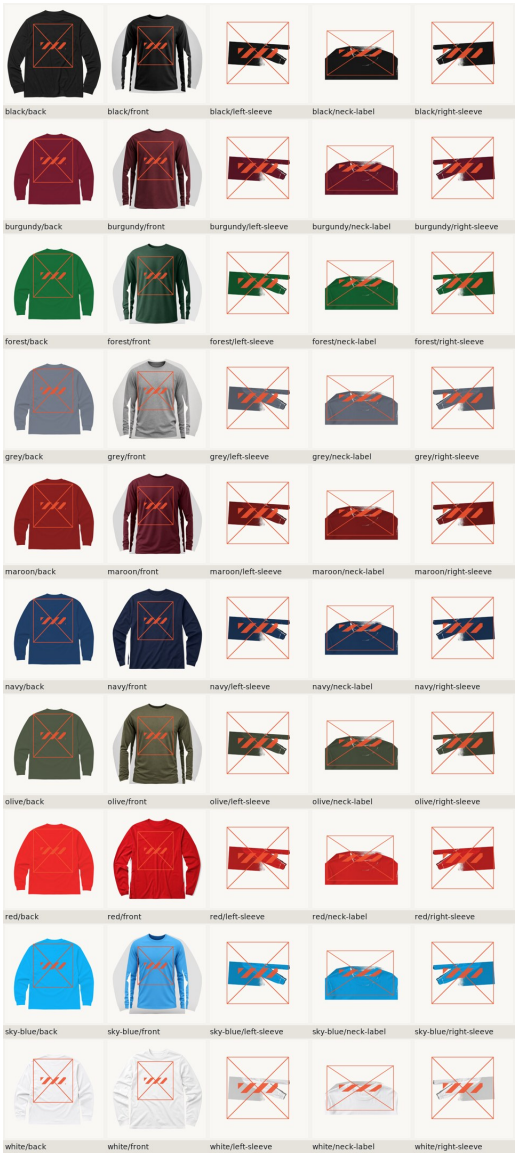

Hoodie contact sheet

Coverage evidence. Red guides are intentional print-zone review guides.

Longsleeve contact sheet

Coverage evidence. Red guides are intentional print-zone review guides.

Mug contact sheet

Coverage evidence. Red guides are intentional print-zone review guides.

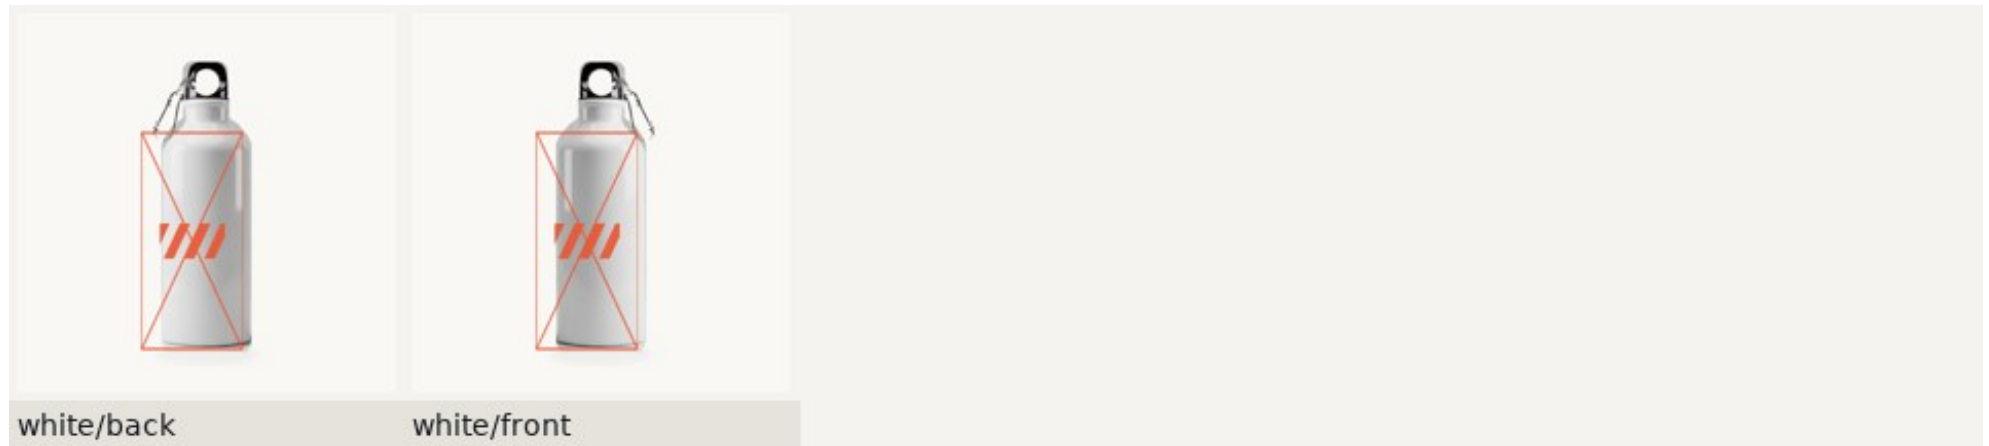

Cap contact sheet

Coverage evidence. Red guides are intentional print-zone review guides.

Waterbottle contact sheet

Coverage evidence. Red guides are intentional print-zone review guides.

Browser, admin, and release limitations

The managed application workflow is running and direct proxied API checks pass. A fresh browser screenshot could not be captured because the artifact preview registry reports that this checkout is not registered; the browser-use CLI is also unavailable in the environment. This is a verification limitation, not evidence of a runtime failure.

Unauthenticated admin-health	Verified fail-closed: 401 unauthorized
Authenticated admin-health	Not claimed; no safe existing session or in-process credential path was available
Browser visual flow	Not claimed; registry lookup failed and browser-use CLI is unavailable
Public PSD/PSB exposure	PASS - static scan found zero PSD/PSB files under public runtime paths
Production promotion	Not performed; active resolver remains on reviewed runtime assets
Next release gate	Obtain controlled browser/runtime comparison and explicit visual acceptance for all 188 surfaces

Final handoff

Native editable masters are structurally verified in quarantine; application, mobile, and dependency gates are green; protected routes reject invalid access; and the only release blockers are the unavailable visual/browser evidence path and the intentional requirement for controlled visual approval before promotion.

Safe next action: keep masterStatus=manifest-only/structurally-verified, obtain the missing controlled visual/runtime evidence, then promote only reviewed runtime derivatives and manifest data followed by production smoke checks.
